

Digital Signatures

We're excited to announce the addition of Digital Signature functionality to Notate, our enterprise document management solution. This powerful new feature enables secure, legally-binding signatures directly within the application you already use for document viewing and collaboration.

What Are Digital Signatures?

Digital signatures go beyond simple electronic signatures by providing:

Authentication

Verify the identity of the signer with cryptographic certainty

Integrity

Guarantee that the document hasn't been altered since signing

Non-repudiation

Prevent signers from denying their signature later

Compliance

Meet legal and regulatory requirements for document signing

How It Works

Digital signatures in Notate combine the ease of use you expect with enterprise-grade security:

1

Create your signature

Draw, type, or import your signature as usual

2

Convert to digital

One tap converts your visual signature into a cryptographically secure digital signature

3

Select your certificate

Choose from your available signing certificates

4

Sign and secure

The document is cryptographically signed and protected against tampering

Key Benefits for Organization

- 1 Enhanced Security**

Digital signatures use PKI (Public Key Infrastructure) technology to provide the highest level of security for your signed documents.
- 2 Streamlined Workflows**

No more printing, signing, and scanning. Complete signature processes entirely within Notate, saving time and reducing errors.
- 3 Global Acceptance**

Digital signatures created in Notate comply with international standards including eIDAS (EU), UETA and ESIGN (US), and are recognized worldwide.
- 4 Audit Trail**

Digital signatures created in Notate comply with international standards including eIDAS (EU), UETA and ESIGN (US), and are recognized worldwide.
- 5 Desktop Compatibility**

Digital signatures created in Notate comply with international standards including eIDAS (EU), UETA and ESIGN (US), and are recognized worldwide.

Getting Started

Digital signatures are being rolled out to all corporate users this month. The first time you open Notate after the update, you'll receive a brief introduction to the new functionality.

For administrators:

Digital signatures can be configured through your UEM server in the Notate application policies section. This allows you to enable or disable the feature and configure certificate requirements according to your organization's security policies.

For users:

Simply tap the signature button in the editing toolbar and select "Convert to Digital Signature" after creating your visual signature. The system will guide you through the process of selecting a certificate and completing the signature.
